Subject: Re: Checking in before COB [Stanford PRA]

Hi Jason,

Although what you have here is not incorrect, it seems slightly incomplete since it does not specify a year or how the data should be broken down. So I would slightly clarify the parameters as follows:

- a. For CY 2017 only and broken down by regional center, number of Lanterman-eligible consumers living in Residence Types 1, 2 or 3 (it's OK to combine counts across all three residence type categories, you do not need to break them out).
- b. For CY 2017 only and broken down by regional center, number of Lanterman-eligible consumers living in Residence Types 1, 2 or 3 who show POS but do not have Medi-Cal (it's OK to combine counts across all three residence type categories, you do not need to break them out).

c. For CY 2017 only, number of Lanterman-eligible consumers living in Residence Types 4, 5 or 6 (it's OK to combine counts across all regional centers and across all three residence type categories, you do not need to break them out).

Can I assume that the cost estimate is still accurate?

Thanks,

██████████

Cost estimate for the following data extraction is \$██████████ Please confirm the below parameters:

- a. Lanterman-eligible consumers living in Residence Types 1, 2 or 3 (it's OK to combine counts across all three of these categories, you do not need to break them out)
- b. Lanterman-eligible consumers living in Residence Types 1, 2 or 3 who show POS but do not have Medi-Cal (it's OK to combine counts across all three residence type categories, you do not need to break them out)
- c. Lanterman-eligible consumers (not broken down by regional center) of the total number of Lanterman-eligible consumers living in Residence types 4, 5 or 6.

Once confirmed I will have them start the programming with the expectation that payment is in route.
